

Achieve Results Domain Assignment

Part 1: Values

The Values:

- **Care:** We care about our colleagues, customers, communities, and the environment.
- **Ownership:** We approach each day with personal accountability and commitment.
- **Respect:** We act with integrity, respect, and openness every day.
- **Excellence:** We lead together through innovation and superior performance.

Critical Reflection: Does this value truly reflect our workplace culture?

In my workplace, Ownership and Excellence aren't just reflected—they are enforced. These values dominate the culture because they are tied to the metrics we see every day like prescription counts, wait times, and the requirement for zero errors. We are constantly pushed to "take ownership" of the queue and speed up our workflow to meet that standard of excellence.

In contrast, Care and Respect tend to slip when things get busy. There is a real struggle between "Excellence" (speed) and "Care" (empathy). When the pharmacy is slammed, the pressure to clear the line forces us to prioritize tasks over people. I've noticed that "Respect" can turn into rigid orders when the team is stressed, and "Care" gets reduced to just checking for drug interactions rather than actually supporting the person in front of us. Ultimately, the culture prioritizes the values we can measure over the ones we have to feel.

If a value is not reflected, how would I adapt the value to make it true?

"Care" is often treated as an external metric—like how fast we help a patient or how many flu shots we do. The irony is that in our effort to "care" for the patient by rushing, we often neglect the care of our colleagues. This leads to missed breaks, high stress, and burnout. When the staff is burnt out, "Care" feels like a corporate slogan, not a reality.

To make this value true, I would flip the definition of Care to be "Inside-Out." I want to treat provider well-being as a patient safety standard. Practically, this means changing our team mindset. We need to view "taking a minute to breathe" or "helping a stressed colleague" not as wasting time (which hurts business), but as preventing errors (which helps business).

Part 2: Vision

The Vision Statement: Shoppers Drug Mart's vision is "To be the leader in helping Canadians discover a healthier outlook on life." This statement marks a major shift from the company's old identity as a convenience store to its modern role as a healthcare destination.

Internal Factors Influencing the Statement: This vision came from realizing that the Canadian healthcare system is under strain. Leaders recognized that pharmacists are the most accessible healthcare providers in the country. By changing the goal from "selling products" to "discovering health," the organization justified a massive expansion of our scope—moving into prescribing, chronic disease management, and clinics. Also, the acquisition by Loblaw influenced this vision to align with their purpose: "Live Life Well." This required a vision that connected nutrition and medicine, positioning the store as a total wellness hub rather than just a dispensary.

Addressing Strengths, Needs, and Intentions: This vision uses the organization's biggest strength: accessibility. With a store minutes away from most Canadians, Shoppers is uniquely positioned to lead this change because we physically exist where life happens. It also addresses a critical business need: standing out. In a market full of online retailers, "selling things" is a race to the bottom on price. "Helping Canadians discover health" is a service that online competitors can't easily copy.

Finally, the vision clarifies the intention to move up the value chain. It signals to us—pharmacists and technicians—that our role isn't just transactional (counting pills) anymore; it's transformational (improving health). This aligns with the "Excellence" value, pushing us to innovate beyond standard dispensing.

Part 3: Insights

Insight: Aligning Personal Behavior with Organizational Results

After completing this domain, my perspective on how to help the organization achieve "better results" has shifted significantly. Before this, I defined "results" strictly through Excellence and Ownership—specifically, my accuracy, speed, and ability to clear the queue. I thought that by being the most reliable, error-free technician, I was doing my part to help Canadians "discover a healthier outlook."

However, looking at the feedback from the *Engage Others* domain showed me that focusing so hard on "Ownership" was actually hurting the value of Care. By being rigid and quiet to maintain focus, I was creating an environment where the team felt judged rather than supported. My view has changed. I realize now that I can't help the organization achieve its vision alone. To truly be a "leader in health," I have to live the Care value internally with my team, not just externally with patients. If my colleagues feel stressed or unheard because of my leadership style, they can't provide the compassionate care our patients need. To help the organization get better results, I need to stop just "protecting standards" (defensive) and start "empowering people" (growth). By explaining the "why" behind safety protocols and checking in on my team's well-being, I'm not lowering the bar for Excellence; I'm building the safety needed to keep it there.
