DEFINITIONS

Deductible

- A fixed amount the patient pays regularly (e.g. annually, quarterly) for eligible medications before the insurance plan starts to share in the cost of the drug

Coinsurance

- Percentage of the drug cost to be paid by the patient or employer
- May be expressed from the patient's perspective (20% co-insurance meaning the patient pays 20%) or the employer's perspective (80% co-insurance meaning the employer pays 80%)
- Typically kicks in after the patient pays their deductible

Copay (copayment)

- Flat fee the patient pays for each drug filled
- Covers a portion of the cost of the drug

Dispensing fee

- Flat fee set by the pharmacy for each drug dispensed
- Totally separate from the deductible

There are many different types of insurance plans with many exceptions. Follow the rules outlined on this slide unless the question instructs you to do otherwise

INSURANCE CALCULATIONS PRACTICE

AY is a 26-year-old female who is a new patient at the pharmacy. She is looking to fill a prescription for a 90-day supply of escitalopram 10 mg tablets. She has a private insurance plan with no deductible but must pay 5% of her drug cost as co-insurance. Her insurance plan is willing to pay up to \$10 per dispensing fee. AY's total prescription cost is \$21, and the pharmacy's dispensing fee is \$11.

What is the cost of the medication?

How much does AY have to pay?

How much does AY's insurance have to pay?

INSURANCE CALCULATIONS PRACTICE

AY is a 26-year-old female who is a new patient at the pharmacy. She is looking to fill a prescription for a 90-day supply of escitalopram 10 mg tablets. She has a private insurance plan with no deductible but must pay 5% of her drug cost as co-insurance. Her insurance plan is willing to pay up to \$10 per dispensing fee. AY's total prescription cost is \$21, and the pharmacy's dispensing fee is \$11.

What is the cost of the medication?

$$\$21 - \$11 = \$10$$

How much does AY have to pay?

AY must pay 5% of the drug cost as co-insurance, and the portion of the dispensing fee not covered by her plan.

$$\text{Co-insurance: } 0.05 \times \$10 = \$0.50$$

$$\text{Dispensing fee portion: } \$11 - \$10 = \$1$$

$$\text{AY must pay } \$1.00 + \$0.50 \text{ in total, or } \$1.50$$

How much does AY's insurance have to pay?

$$95\% \text{ of drug cost } (0.95 \times \$10 = \$9.50) + \text{dispensing fee portion } (\$10) = \$19.50$$

INSURANCE CALCULATIONS PRACTICE

3 months later, AY approaches the pharmacy looking for a refill for her escitalopram tablets. She has a new insurance plan that has a \$50 deductible and a co-pay of \$6. AY has not made any contributions to her deductible. Suppose the insurance plan is willing to pay \$10 per dispensing fee, regardless of whether or not the deductible is satisfied, and that her co-pay will NOT be applied to her deductible. Her total prescription cost is \$21, and the pharmacy's dispensing fee is \$11.

How much does AY's insurance have to pay?

How much does AY have to pay out of pocket?

How much will AY have contributed to her deductible?

INSURANCE CALCULATIONS PRACTICE

3 months later, AY approaches the pharmacy looking for a refill for her escitalopram tablets. She has a new insurance plan that has a \$50 deductible and a co-pay of \$6. AY has not made any contributions to her deductible. Suppose the insurance plan is willing to pay \$10 per dispensing fee, regardless of whether or not the deductible is satisfied, and that her co-pay will NOT be applied to her deductible. Her total prescription cost is \$21, and the pharmacy's dispensing fee is \$11.

How much does AY's insurance have to pay? \$10

- AY's insurance will cover up to \$10 per dispensing fee, regardless of whether or not the deductible is paid off
- Since AY has not paid off her deductible, insurance will pay \$10 towards the dispensing fee and \$0 towards the drug cost

How much does AY have to pay out of pocket? \$11

- AY has to pay the remainder of the prescription cost out of pocket: $\$21 - \$10 = \$11$

How much will AY have contributed to her deductible?

- | | | |
|--|----|--|
| <ul style="list-style-type: none">• Calculate the drug cost by subtracting the dispensing fee from the prescription cost: $\\$21 - \\$11 = \\$10$• AY has a co-pay of \$6 that is NOT applied to the deductible• The remainder of the drug cost will go towards AY's deductible: $\\$10 - \\$6 = \\$4$ | OR | <ul style="list-style-type: none">• AY pays \$11 out of pocket, \$6 of which is the copay (which does not contribute towards the deductible).• We are left with \$5. \$1 of that goes towards the rest of the dispensing fee (since insurance paid \$10 out of \$11), so we are left with \$4.• Therefore, \$4 is what contributes to her deductible |
|--|----|--|

INSURANCE CALCULATIONS PRACTICE

RR is a 69-year-old male who is a regular patient at your pharmacy. He is requesting refills for three of his prescriptions: amlodipine 5 mg, amitriptyline 25 mg, and clopidogrel 75 mg. He has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The costs of his medications are as follows:

Amlodipine 5 mg: \$12

Amitriptyline 25 mg: \$10

Clopidogrel 75 mg: \$25

The pharmacy's dispensing fee is \$13

What would be the total cost of filling all three medications if RR didn't have an insurance plan?

INSURANCE CALCULATIONS PRACTICE

RR is a 69-year-old male who is a regular patient at your pharmacy. He is requesting refills for three of his prescriptions: amlodipine 5 mg, amitriptyline 25 mg, and clopidogrel 75 mg. He has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The costs of his medications are as follows:

Amlodipine 5 mg: \$12

Amitriptyline 25 mg: \$10

Clopidogrel 75 mg: \$25

The pharmacy's dispensing fee is \$13

What would be the total cost of filling all three medications if RR didn't have an insurance plan? **\$86**

- Remember, the dispensing fee is per drug
- Total cost = cost of amlodipine + cost of amitriptyline + cost of clopidogrel + 3 dispensing fees
= $\$12 + \$10 + \$25 + (\$13 \times 3) = \$86$

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for amlodipine?

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for amlodipine?

- Drug cost = \$12
 - RR has paid \$68 towards his \$100 deductible. Therefore, he has \$32 left on the deductible (\$100 - \$68)
 - The entire drug cost will go towards RR's deductible
 - How much does RR have left on his deductible? $\$32 - \$12 = \$20$
- Dispensing fee = \$13; the plan will pay \$10, RR has to pay the remaining \$3 out of pocket
- Total RR has to pay for amlodipine = $\$12 + \$3 = \$15$

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for amitriptyline?

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for amitriptyline?

- Drug cost = \$10
 - As of the last prescription, RR has \$20 left on his deductible
 - The entire drug cost will go towards RR's deductible
 - How much does RR have left on his deductible? $\$20 - \$10 = \$10$
- Dispensing fee = \$13; the plan will pay \$10, RR has to pay the remaining \$3 out of pocket
- Total RR has to pay for amitriptyline = $\$10 + \$3 = \$13$

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for clopidogrel?

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for clopidogrel?

- Drug cost = \$25
 - As of the last prescription, RR has \$10 left on his deductible
 - \$10 of the drug's \$25 cost is enough to satisfy RR's deductible, the remainder is subject to 10% co-insurance
 - RR must pay 10% of the remaining \$15 of the drug cost, or $0.10 \times \$15 = \1.50
- Dispensing fee = \$13; the plan will pay \$10, RR has to pay the remaining \$3 out of pocket
- Total RR has to pay for clopidogrel = \$10 (deductible) + \$1.50 (co-insurance) + \$3 = \$14.50

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for all three prescriptions?

How much is RR's insurance plan paying for all three prescriptions?

INSURANCE CALCULATIONS PRACTICE

RR has an annual deductible of \$100 and must pay 10% of his drug costs as co-insurance once he has satisfied his deductible. Additionally, RR's insurance plan will pay up to \$10 per dispensing fee, regardless of whether or not the deductible is satisfied. Suppose that RR has contributed \$68 towards his deductible this year.

The cost of his medications are as follows:

Amlodipine 5 mg: \$12, Amitriptyline 25 mg: \$10, Clopidogrel 75 mg: \$25

The pharmacy dispensing fee is \$13

Let's say your pharmacy processed the amlodipine first, then amitriptyline, and then clopidogrel.

How much does RR have to pay out of pocket for all three prescriptions?

- \$15 (amlodipine Rx) + \$13 (amitriptyline Rx) + \$14.50 (clopidogrel Rx) = \$42.50

How much is RR's insurance plan paying for all three prescriptions?

- \$10 per Rx towards the dispensing fees X 3 dispensing fees = \$30 in dispensing fees
- 90% of the remaining drug cost on the clopidogrel Rx: $0.90 \times \$15 = \13.50
- Total = \$30 + \$13.50 = \$43.50
